Project Configuration	3
Script Information	6

## Project Configuration

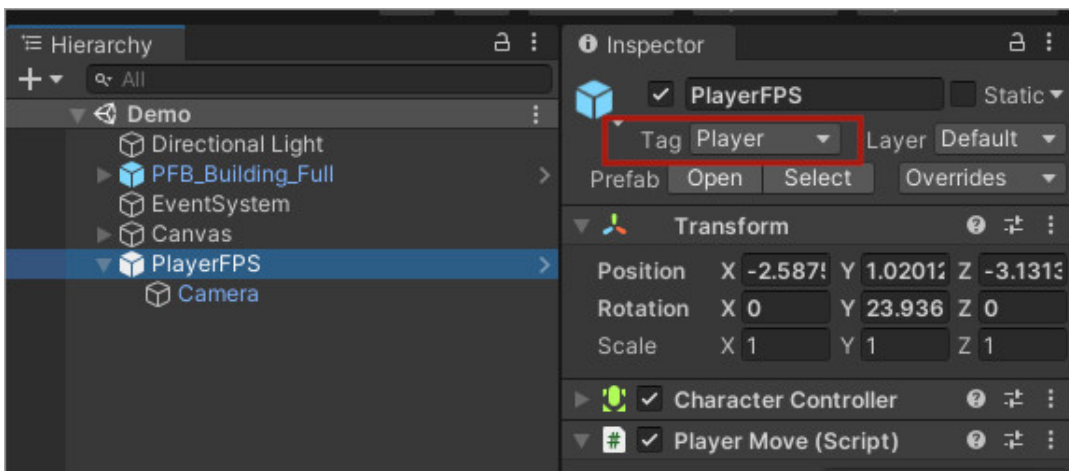

Objects that the player can interact with are controlled via C# Script `MoveObjectController`. In order for the script to work correctly the project needs to be configured in the following way.

- 1) Ensure you have a layer named `InteractRaycast`. To check this from the menu go to Edit -> Project Settings -> Tags and Layers.

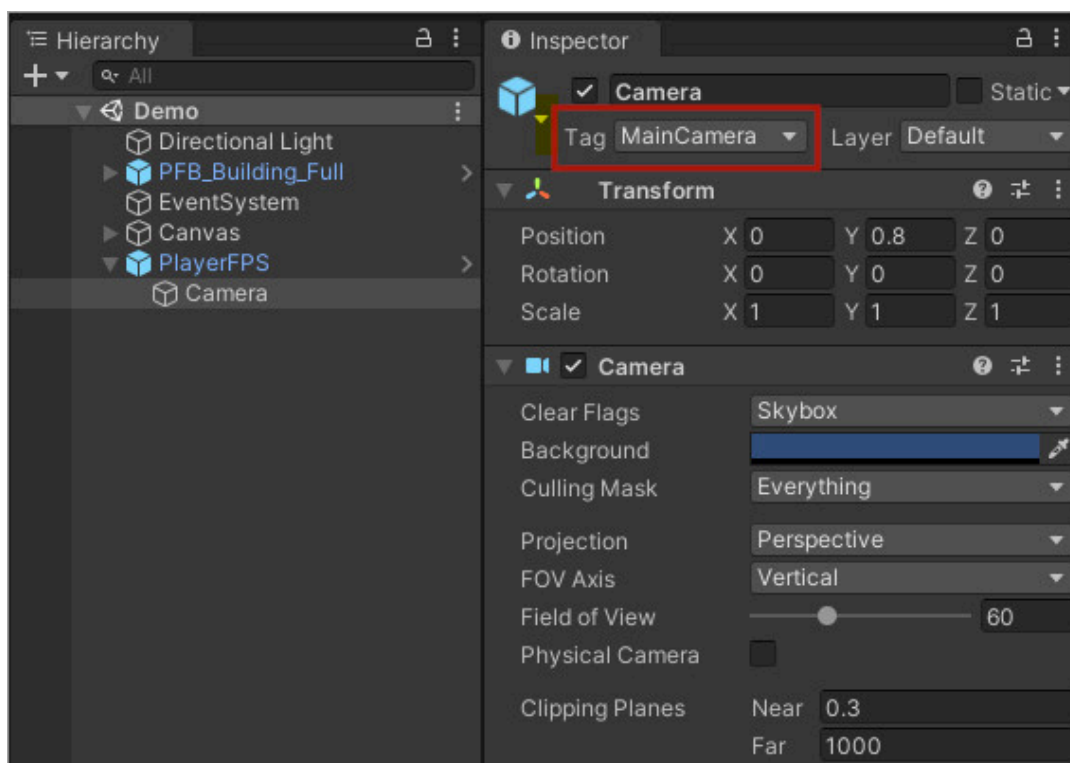

This is used by the script to mask the raycast to objects that can be interacted with only.

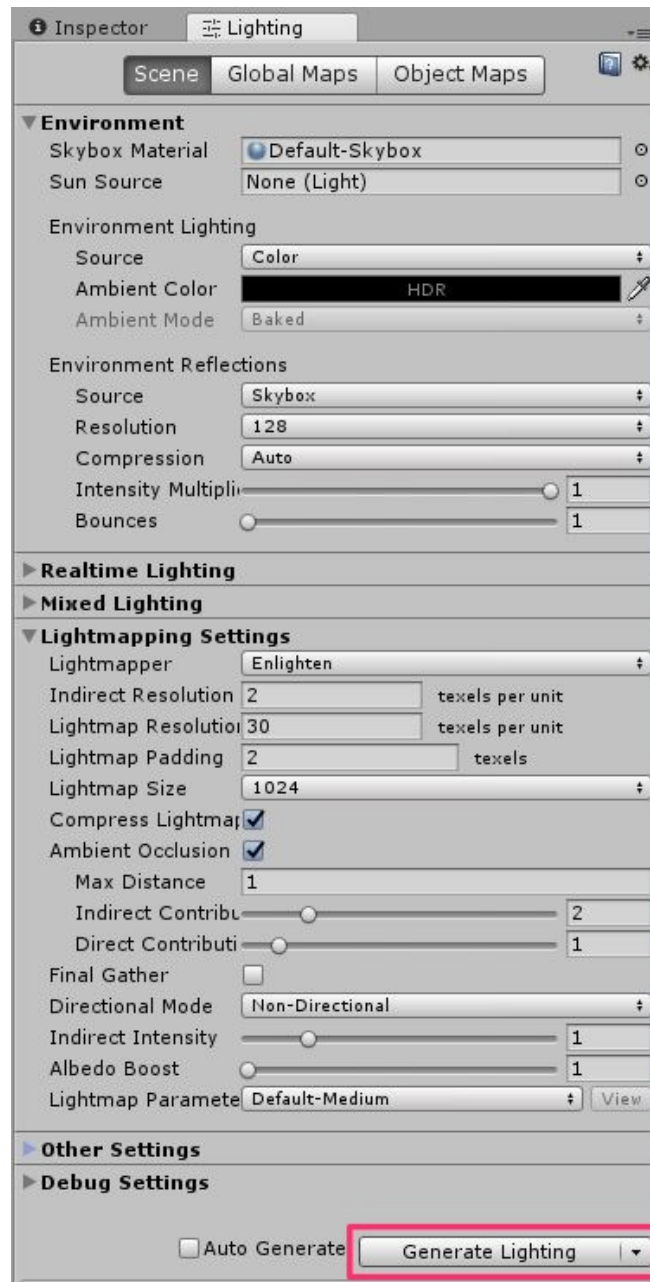

2) Player game object needs to be tagged as `Player`

3) Object containing camera needs the tag `MainCamera` applied

4) This asset contains Baked Lights. Bake the lighting information by opening the Lighting window and clicking Generate Lighting.  
From the menu: Window -> Lighting

---

## Script Information

The C# script `MoveObjectController` is used to control player interaction.

Property: - Reach Range  
Determines the distance the player can reach.
